Animals In Translation: Using The Mysteries Of Autism To Decode Animal Behavior (Scribner Classics)

Synopsis

In this exciting new e edition, Temple Grandin returns to her groundbreaking work, *Animals in Translation*, to address the last ten years of developments in behavioral research, animal welfare, and farming regulations. Originally published in 2005, *Animals in Translation* received unanimous critical praise and was a bestseller in both hardcover and paperback, and Grandin's Q&A updates this classic text with the most current scientific research. Grandin's training as an animal scientist and her experience as a person with autism give her a perspective unlike any other expert in the field. Grandin and coauthor Catherine Johnson present their powerful theory that people with autism may be able to empathically understand animal behavior in a way that eludes neurotypical people—putting them in the ideal position to translate a animal talk. • Exploring animal fear, pain, aggression, love, friendship, communication, learning, and even genius, Grandin is a faithful guide into their world. Grandin, standing at the intersection of autism and animal science, offers unparalleled observations and extraordinary ideas, revealing that animals are smarter and more complex than anyone could have imagined.

Customer Reviews

What author Temple Grandin has attempted to do here is to use her own experiences as an autistic person to gain insight into the way animals perceive and react to the world around them. She explains that autism seems to impair the ability of the neocortex, or frontal lobes of the brain, to obtain and process information, and that animals likewise have less well-developed frontal lobes than normal humans do. Her theory is that the impairment of an autistic person's brain, in essence, makes them far closer to other animals than to non-autistic humans in how they view the world. As a result, Grandin has largely been able to help people better relate to their pets, and also to design more humane slaughterhouse equipment and more effective auditing procedures for slaughter facilities. The book starts off well, with Grandin offering many insights that show that, in some ways, she really does have a better understanding of animal perception and thought than "normal" humans. Her principle examples revolve around the fact that animals, like autistic people, are detail-oriented. Their inability to generalize and see the "big picture" often leads to fixations on small things that the average person would not notice. Grandin illustrates this with stories from her inspections of meat plants, where something as simple as an abrupt change in lighting, or a reflection on a puddle - things which have entirely escaped the plant operators' notice - have been causing cattle to balk and refuse to go where they are being directed. She goes on to explain exactly why these details, which don't seem like much of a reason to be afraid, are so disturbing to the animals. Her observations, while not things that would immediately jump out at most people, make a lot of sense once she has explained them.

Animals in Translation: Using the mysteries of autism to decode animal behavior. I will never think about animals, and about autism, and about "normal" people quite the same way again. This is a landmark book. The book is badly organized. You will have to read every page. You may not be interested in the long pages where she talks about slaughter houses, but then right in the middle of a paragraph you suddenly come across a bit of wisdom that you would not want to have missed. Right then you must underline it or you will never find it back again. The upshot of this book is that animals do not have a fully functioning frontal lobe, nor do autistic people, and she tells us throughout the book what that is like, over and over again until you start to get a deep understanding of what it is like. We get a better understanding of ourselves too. The frontal lobe "puts it all together", and having put it all together, we race over the details like a speed boat over water. We do not see the details. An autistic person on the other hand, can not help but see them. He sees all the details, and only the details. He is overwhelmed by them. He sees all forty shades of brown. He can not see the forest for the trees, and more trees, and more trees. He hears every

tone. He smells every odor. His life is a jumble of details. As you might expect, her book is rich in details about her own life and about all the animals she knows and when you emerge at the other end of the book, you feel immersed. Being a "normal" person you can not remember all the details, but you "know" something about these people's lives, and about animals' lives in a way you could never get from a text book. And yet, at the same time, she also has a doctorate and she does her own research.
